	Whether and how any other features of the option/RSU grant were incorporated into the measurement of fair value, such as a market condition			1. Exercise price – It is the price at which, the right is exercisable by the holder of the option. 2. Current market price of the underlying asset – The payoff from the option is related to the difference between the exercise price and the current price of an underlying asset. 3. Time to expiration – The value of an option is related to the duration of the option contract. The value of an option increases with the increase in its term. Generally, it is optimal to exercise an option at the end of the option term. 4. Volatility of the underlying asset – Volatility is a measure of the movement in the prices of the underlying asset. 5. Risk-free interest rate – This impacts the return expectation of equity. An increase in the risk-free rate increases the value of a call option and reduces the value of a put option. 6. Dividends expected during the life of the option – Dividend outflow reduces the value of the underlying asset. Thus, the dividend rate reduces the value of a call option and increases the value of a put option.			1.
